A SMALL-TOWN STUDENT IN A BIG TECH WORLD

Ravi was a student from a small town. His town had narrow roads, few buses, and only one internet café. Most people there worked in farms or small shops. Very few students talked about technology or big companies. Ravi studied in a government school and learned computer basics only once a week.

Ravi loved computers, but he did not have a laptop at home. He practiced typing and coding on old computers at the internet café. Sometimes the power went off, and sometimes the internet was very slow. Still, Ravi never stopped learning. He watched free videos, read notes, and practiced whenever he got time.

After completing school, Ravi joined a BTech college in a big city. Everything felt new and difficult. His classmates spoke fluent English, used high-end laptops, and already knew programming. Ravi felt nervous and small among them. In the first semester, he struggled with subjects like programming, data structures, and mathematics.

Instead of giving up, Ravi decided to work harder. He woke up early, revised basics, and practiced coding every day. He asked doubts without fear and used free online platforms to learn. Slowly, his confidence grew. He started understanding concepts clearly and even helped his friends.

By the final year, Ravi completed small projects, attended online workshops, and improved his skills. During placements, he faced many interviews and failed a few. But he learned from every failure. Finally, he got selected in a tech company.
When Ravi went back to his town,

everyone felt proud of him. He became an example for many students. Ravi understood one important thing: coming from a small town is not a weakness; strong effort and learning make the real difference.

Moral of the Story

Hard work, patience, and continuous learning can help any student succeed in the big tech world—no matter where they come from.
